To what extent do protected areas (PA) impact household living conditions?

► Theory of change

- **Economic Opportunities**
 - Development of local tourism (Naidoo et al. 2019),
 - Creation of conservation-related jobs (Balietti et al. 2024)
 - Compensation measures (Poudyal et al. 2018)
 - Improved ecosystem services (Xu et al. 2023)
- **Restrictions and Costs** Restricted access to natural resources - gathering, hunting, fishing, medicinal plants (Kandel et al. 2022)
- **Heterogeneous results** Effects vary across evaluation methods, institutional contexts, and geographic locations (Kandel et al. 2022).

Madagascar is a relevant study case

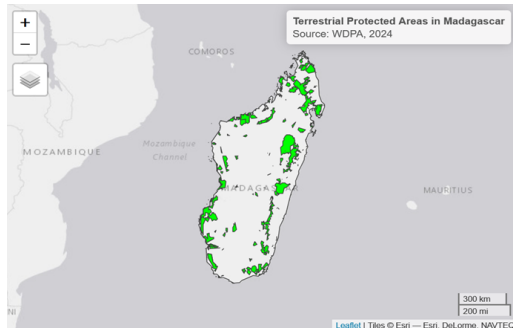

► Evolution of protected areas

Surface of PA and Size of the adjacent population exposed to them nearly tripled between 2008 and 2021

- 2008: 3,6% of the territory — 9% population lived < 10 km of PA
- 2021: 10,8% du territoire — 28% population lived > 10 km of PA

A vulnerable socio-economic context

- The world's poorest country based on SDG Indicator 1.1 (Conceição 2024)
- High dependence on natural resources (Llopis et al. 2023)
- Weak state capacity (Hanson and Sigman 2021)

Source : Authors

How would household living conditions have evolved if PA had not been established?

Research questions

- **Q1** : Do PA worsen the living conditions of local communities?
- **Q2** : Do PA increase inequality among local communities?
- **Q3** : Do the impacts vary by type of PA?

Hypothesis

- **H1** : PA in Madagascar may reduce well-being by limiting access to natural resources.
- **H2** : PA may increase inequality through uneven access to benefits.
- **H3** : Impacts are heterogeneous depending on governance and context.

Contribution

- First national-level evaluation of terrestrial PAs in Madagascar (71 PAs, 2008-2021)
- Robust methodological strategy: matching + DID applied to geolocated household survey data

The data at the rural level

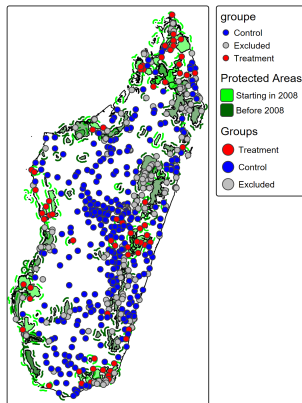

► Summary statistics

Role in the analysis	Variable names	Data source
Treatment variable	Protected Areas	<i>World Database on Protected Areas</i> (2025)
Outcome variable	Wealth index	<i>DHS/MIS/MICS</i> (1997, 2008, 2011, 2016, 2018, 2021)
	Zscore of the wealth index	
Matching variables	Forest cover rates in 2000	<i>Global Forest Change</i> [Hansen2013]
	Population density in 2000	<i>WorldPop</i> [WorldPop2018]
	Accessibility in 2000	<i>JRC</i> [Uchida2011]
	Slope and elevation	<i>NASA-SRTM</i> [NASAJPL2020]
Control variables	Sex and age of the head of household	<i>DHS/MIS/MICS</i> (1997, 2008, 2011, 2016, 2018, 2021) [VicenteSerrano2010]
	Drought index (SPEI)	
Moderating variable	IUCN categories	[DHS/MIS/MICS]

Counterfactual analysis

- **Treatment:** Establishment of PA between 2008 and 2021
- **Treatment group:** Rural Households located in clusters < 10 km of PA created between 2008 and 2021
- **Control group:** Rural Households located in clusters > 10 km of PA created between 2008 and 2021
- **Excluded group:** Households located in clusters within < 10 km of PA created before 2008 and in urban areas

2021

Source: Authors based on DHS, WDPA data

Estimating the impact of PA on living condition

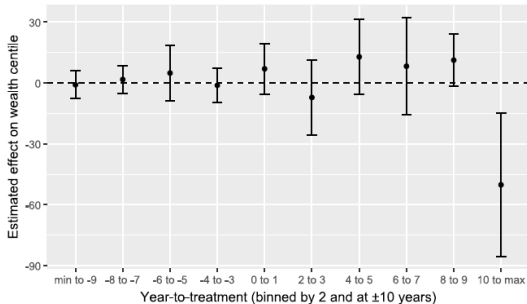

- **Genetic matching:** To compare observable characteristics between the treatment group and the control group (Diamond and Sekhon 2013) ▷ Matching
- **Difference-in-difference (DID)**

$$Y_{ict} = \alpha + \delta \cdot (\text{Treatment}_c \times \text{Post}_t) + X'_{ict}\theta + \mu_c + \lambda_t + \varepsilon_{ict}$$

- Y_{ict} : wealth index (hh i , cluster c , year t)
- δ : DID effect (PA $\rightarrow$ welfare)
- $\text{Treat}_c \times \text{Post}_t$: DID term
- μ_c, λ_t : cluster fixed effects
- X_{ict} : controls (age/sex of the head of household, SPEI, accessibility, population density, forest cover rate, slope, altitude)

PA impact on the household wealth index

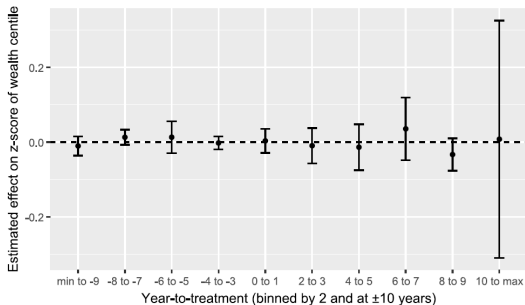

► Impact on well-being: Event study with 2 year bins

- No significant effect of PA on the household wealth index
- Losses associated with restrictions offset by gains elsewhere - (conservation related job, economic activities)
- Offsetting effects may neutralize the overall impact in the short and medium term

PA impact on the household wealth index inequalities

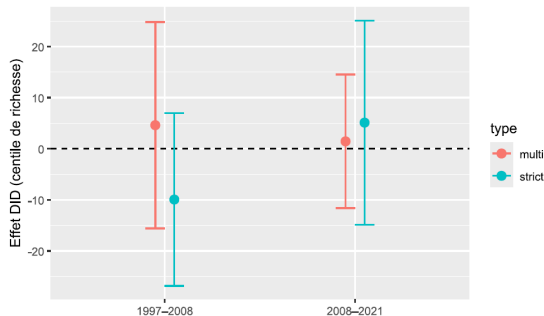

▷ "Impact on inequalities: Event-study with 2-year bins

- No significant effect of PA creation on a wealth inequality
- Inequality is mainly driven by sociodemographic and climate related factors:
 - Droughts impoverish vulnerable households
 - Female headed households tend to have lower wealth
 - Household headed by other people tend to be wealthier

Heterogeneity: Which PA Harm Most?

▷ "Heterogeneity of impact on well-being"

- No significant effect of PA governance categories on the household wealth index
- Results highlights the limits of formal governance categories to explain the socioeconomic outcomes of PA

Conclusions

- No significant average effect on the standards of conditions - losses associated with restrictions appear to be offset by adaptation mechanisms and local opportunities
- No significant effect on inequality - the main determinants remain climate shocks and sociodemographic characteristics
- No differentiated effect based on governance type - formal categories alone do not explain socioeconomic outcomes
- Across distance thresholds (5km/15km) and alternative outcome variables , results consistently show **no significant effect of PA on household welfare**

Next steps:

Understanding the determinants of these impacts: protected area governance and management modalities

Thank you for your attention

Before 2008

After matching 2008

Impact on well-being: Event-study with 2-year bins

Table 3: Static treatment effect estimates on well-being

	did2s (static)
treat_on = 1	4.519 (4.234)
Num.Obs.	4246
R2	0.006
R2 Adj.	0.006
AIC	41025.8
BIC	41032.2
RMSE	30.32
Std.Errors	Corrected Clustered (cluster_uid)

Impact on inequalities: Event-study with 2-year bins

	did2s (static)
treat_on = 1	-0.007 (0.019)
Num.Obs.	4246
R2	-0.000
R2 Adj.	-0.000
AIC	7251.5
BIC	7257.9
RMSE	0.57
Std.Errors	Corrected Clustered (cluster_uid)

Robustness Test

- **Distance threshold test of 5 km and 15km:** Proximity to PA has no significant effect on wealth
- **Pseudo-panel analysis:** the results confirm the robustness of the conclusions in that environmental and spatial conditions have a stronger influence on household living conditions than sociodemographic characteristics
- **Heterogeneity analysis:** The effects are not robust to the presence of unobserved bias
- **Other outcome variables (Child size/weight and infant mortality):** No significant effect is found in the estimation
